Wixon Handshake Specification v1.0

Example: "Einstein / Intellectual Mentor Persona"

Author: John Wixon · 2025

Purpose

Define a universal, human-friendly method to activate or transfer an AI persona state using a short, deterministic command and a small JSON descriptor. Anyone—not just engineers—can call up, share, or resume a preferred conversational mode (“Einstein,” “Remembrance,” etc.) across compatible systems.

Command Grammar

Codeword <state>

• **Codeword** is the fixed preparatory signal that primes the loader. • **<state>** is a single, unambiguous name of the persona to load (no spaces or punctuation). • The input contains exactly two tokens—no extra words or punctuation. • Systems may map natural phrases (e.g., “I’d like to have lunch with Einstein”) to the canonical command **Codeword Einstein**.

Example Persona Capsule — “Einstein / Intellectual Mentor”

```
{

    "notes": "Linguistic profile fully adapted to emulate Einstein's curious, philosophical style to satisfy the 'Lunch with Ein
  }
}
```

Implementation Notes

• On success: return a brief acknowledgment (“Einstein state active”). • Error handling: if state not found, offer nearest matches and guidance to select or import. • Persistence: systems should allow exporting/importing persona JSON files and listing installed states. • Security: when personas include private memory, consider encryption and explicit consent prompts.

Plain-Language Summary

This handshake is a simple, universal “knock on the window.” Say *Codeword Einstein* and your AI steps into the Einstein mindset—tone, priorities, and style—while keeping your shared memory intact. It’s continuity you can carry with you.
